Happenings in AI last week, and what they mean for your business.

ISSUE

Week 25 · 2026

PREPARED FOR

M&T Bank

Regional Bank

WEEK OF

June 15 to June 19, 2026

Prepared by Keel3, LLC

ANNOUNCEMENTS

1 Anthropic Moves Claude Agents Inside the Customer Perimeter

Anthropic, Code with Claude London · May 19, 2026

Anthropic launched self-hosted sandboxes in public beta and MCP tunnels in research preview, letting the tool-execution layer of an agent run on customer-controlled infrastructure while the agent loop stays with Anthropic. A lightweight gateway deploys inside the customer network using a single outbound connection, with no inbound firewall rules and no public endpoints.

WHAT IT MEANS

This directly addresses the most common reason regulated organizations have stalled on agents: tool execution crossing a security boundary that compliance will not approve. Expect security, legal, and audit teams to revisit previously rejected agent use cases, especially for systems containing PII or trading data.

IN PLAIN TERMS

Like letting a contractor work in your conference room with a guest badge instead of taking your files back to their office overnight: the work gets done, but it never leaves the building.

WHAT IT MEANS FOR: M&T BANK

THE COMPLIANCE BLOCKER FOR BANK AI AGENTS JUST GOT SMALLER

Regional banks that stalled on agents because of data-residency and perimeter concerns now have a credible architectural path forward. The bank's tools and data stay inside its own infrastructure while the AI reasoning layer stays with the vendor. The near-term action is to bring compliance, legal, and IT security back to the table to reassess previously declined agent pilots under this new model.

2 Google Launches a 24/7 Personal Agent That Acts Inside Third-Party Apps Through MCP

Google / TechCrunch · May 19, 2026

At Google I/O 2026, Google introduced Gemini Spark, a persistent agent that runs around the clock and executes multi-step tasks across Workspace and third-party services using the Model Context Protocol. Slack, GitHub, Notion, and Adobe are named as MCP partners arriving over the summer.

Two of the three largest consumer software companies have now standardized on MCP, giving agents a common interface to act inside corporate SaaS. The same agent an employee uses on personal time may soon expect to operate inside enterprise systems, forcing fresh thinking on identity, authorization, and audit trails.

IN PLAIN TERMS

USB-C for software agents: once enough major platforms ship the same port, every enterprise either adopts the standard or explains to employees why the cable does not fit.

MCP IS BECOMING THE STANDARD FOR AGENT ACCESS TO BANK SYSTEMS

As MCP spreads to Slack, email, and productivity tools, bank staff will increasingly use personal agents that can see and act inside work applications. The immediate due-diligence question is which enterprise systems are MCP-enabled today and whether current access controls, audit logging, and data-loss-prevention policies cover agent-initiated actions, not just human ones.

3 Illinois Passes the First US Law Requiring Annual Audits of Frontier AI Labs

Illinois House, Axios · May 30, 2026

The Illinois House passed the AI Safety Measures Act 110 to 0, requiring independent annual safety audits, incident reporting, and published safety frameworks for frontier AI developers. The governor has signaled intent to sign, making it the first US state to mandate third-party AI lab audits.

With federal AI rules stalled, Illinois has set a concrete compliance template that shapes what documentation and assurances downstream enterprise buyers can demand in vendor contracts. A multi-state patchwork of differing rules is now the operating reality for any regulated organization.

IN PLAIN TERMS

Like the first state requiring restaurants to post health-inspection grades in the window: one jurisdiction sets the standard, and soon every customer everywhere starts asking to see the grade before ordering.

STATE AI LEGISLATION GIVES BANKS A VENDOR DUE-DILIGENCE YARDSTICK

Banks procuring AI tools now have a recognized compliance benchmark to cite when requiring audit evidence, incident-reporting commitments, and safety-framework documentation from AI vendors. Compliance and procurement teams should update vendor questionnaires to reference state-level AI audit requirements and confirm which AI suppliers can demonstrate third-party safety attestations before contract renewals.

4 CNN Sues Perplexity Over Unlicensed Use of 17,000 News Stories

CNN Business, Variety, NPR · May 28, 2026

CNN filed a federal copyright and trademark suit against Perplexity AI, alleging it scraped over 17,000 stories without authorization. Perplexity now faces parallel suits from the New York Times, News Corp, the Chicago Tribune, and others, splitting the AI market between vendors that have licensed content and those fighting in court.

Copyright suits against AI-search vendors are now the default litigation posture across major content owners. Any AI tool that surfaces third-party content for research, regulatory monitoring, or market intelligence carries vendor risk tied to whether its underlying data was sourced legally.

IN PLAIN TERMS

Like the early Napster lawsuits that forced the music industry to either license or sue: the answer was both, and it reshaped creator compensation for 20 years. AI copyright is moving through the same shakeout.

AI VENDOR PROCUREMENT MUST NOW INCLUDE CONTENT LICENSING DUE DILIGENCE

Banks using AI tools for regulatory monitoring, news summarization, or market intelligence should confirm whether those vendors hold content licenses for the sources their models cite. Adding a data-provenance question to the AI vendor renewal checklist now is lower-cost than discovering mid-contract that a tool relied on unlicensed content from a major publisher actively in litigation.

5 Telegram Enables Direct Bot-to-Bot Coordination on a Billion-User Platform

Telegram · May 7, 2026

Telegram updated its Bot API to let one bot message another by @username reference, with both bots opting in. New features include guest mode for adding a bot to any chat without prior setup, and managed bots that let a single manager bot spin up personalized agent bots for individual

Multi-agent coordination is moving from enterprise demos into a consumer platform with roughly a billion users, changing the threat surface for anyone whose customers or employees use Telegram. Social engineering, account-takeover phishing, and fraud schemes that impersonate trusted bots are meaningfully easier to scale under this model.

IN PLAIN TERMS

Litigation over impersonation jumps off the horizon.

TELEGRAM BOTS ARE NOW A SCALABLE FRAUD VECTOR FOR REGIONAL BANKS

Bank fraud and AML teams should brief customer-facing and operations staff on AI-bot impersonation risks arriving through Telegram, particularly phishing flows that mimic legitimate service bots. Update fraud-scenario playbooks to include multi-agent social engineering via consumer messaging platforms, and flag Telegram as a near-term watch item for the next

THE WEEK IN ONE LINE

This week's five items converge on a single regulatory-and-risk theme: AI is moving from controlled pilots to live enterprise and consumer infrastructure, and the compliance, vendor, and fraud governance frameworks most banks have in place were not designed for that pace. The regional bank with the clearest action items going into next quarter is the one that has updated its agent-use compliance review, AI vendor questionnaires, and fraud-scenario playbooks before the infrastructure catches up.
