Happenings in AI last week, and what they mean for your business.

ISSUE

Week 25 · 2026

PREPARED FOR

Incerv

Corporate Compliance & Registered Agent

WEEK OF

June 9 to June 13, 2026

Prepared by Keel3, LLC

ANNOUNCEMENTS	WHAT IT MEANS	WHAT IT MEANS FOR: INCSEV
1 US Export-Control Order Forces Anthropic to Switch Off Fable 5 and Mythos 5 Worldwide <i>Fortune, Axios, Al Jazeera, June 13</i> The Commerce Department invoked national-security export-control authority to bar Anthropic from making its two most powerful models available to any foreign national, including non-citizen employees inside the United States. Because Anthropic cannot verify nationality in real time, it disabled both models for every customer worldwide within hours. The order landed three days after the models launched as the industry's most celebrated release.	For the first time a government, not a vendor, decided who may use a frontier model, turning access into an instrument of state power. Any organization depending on a single frontier vendor now carries geopolitical and regulatory availability risk that can remove capabilities overnight, regardless of contract terms. IN PLAIN TERMS <i>Like a government suddenly revoking the license for the most powerful engine on the market, so every carmaker that used it has to park those cars overnight while older engines keep running.</i>	SINGLE-VENDOR MODEL RISK IS NOW A COMPLIANCE ISSUE A government action just demonstrated that a single frontier vendor can be taken offline in hours. For Incserv, the lesson is that any workflow built on one AI vendor needs a documented fallback. If your filing systems or client portals depend on a specific model tier, map alternatives before the next policy shift.
2 House Bipartisan Draft Would Freeze State AI Laws for Three Years <i>Roll Call, FedScoop, Rep. Obernolte, June 4</i> Representatives Jay Obernolte and Lori Trahan released a 269-page bipartisan discussion draft called the Great American Artificial Intelligence Act. It would preempt state laws that regulate AI model development for three years while letting states continue regulating how AI is deployed. Frontier developers above \$500 million in revenue would be required to publish safety frameworks and undergo third-party audits.	For three years this would replace a growing patchwork of state AI rules with a single federal floor on model development, while leaving deployment rules intact. Regulated firms tracking Colorado's AI Act and similar state laws would gain more uniformity on development, but the preemption provision is the most contested part and may not survive. IN PLAIN TERMS <i>Like the federal government setting one national building code while still letting each city decide how those buildings can be occupied and used.</i>	FEDERAL AI PREEMPTION WOULD RESHAPE STATE COMPLIANCE If federal preemption passes, the patchwork of state AI development rules that Incserv helps clients navigate would simplify for three years. But state deployment rules would remain, meaning the compliance landscape still requires jurisdiction-specific attention. Watch whether the preemption clause survives committee before making any planning changes.
3 Remote-Code-Execution Flaws Hit the Most Popular AI Coding Agents <i>Adversal AI, Microsoft Security, Help Net Security, June 3</i> Researchers disclosed a cluster of serious vulnerabilities across mainstream AI coding agents including a symlink-hijack exploit that broke six agents and a one-click remote code execution reaching Claude Code, Cursor, Gemini CLI, and GitHub Copilot. Microsoft separately found two critical CVEs in its Semantic Kernel framework. An assessment of 100 production agents found nearly all carried conditions for a single hostile document to take them over.	AI coding agents are now a concrete attack surface. The flaws reached the most popular tools and sometimes required only one poisoned file. Any organization piloting agentic AI needs the same controls used for other privileged software: least privilege, sandboxing, and review of what an agent can touch. IN PLAIN TERMS <i>Like discovering that a popular new power tool can be triggered remotely by a stranger if you leave it plugged in. The tool is useful, but you need guards and a way to cut the power.</i>	AGENT SECURITY IS A REGISTERED-AGENT COMPLIANCE ITEM Before deploying any agent tool that touches filing systems, corporate records, or state submissions, require sandboxing, access logs, and explicit audit trails. For Incserv, this is the kind of cyber risk that translates directly into fiduciary exposure if a breach compromises client entity data.
4 OpenAI Models and Codex Go Live on Amazon Bedrock <i>AWS, June 1</i> AWS made OpenAI's GPT-5.5 and GPT-5.4 models and the Codex coding agent generally available on Amazon Bedrock. Pricing matches OpenAI's first-party rates with no AWS surcharge, and usage counts toward existing spending commitments. The models run with AWS-native security controls including IAM policies, VPC isolation, and encryption.	Enterprises in regulated industries can now use frontier OpenAI models through the cloud contract and security review they already have. For organizations on AWS, trying OpenAI models no longer requires onboarding a new vendor with a fresh security review. IN PLAIN TERMS <i>Like a popular specialty brand finally being stocked at the warehouse club where the company already shops. Same product, same price, but on the existing account with existing approvals.</i>	AI PROCUREMENT SIMPLIFIES THROUGH EXISTING CLOUD If Incserv or your clients already run on AWS, the barrier to trying frontier models just dropped. The security and compliance paperwork is handled by the existing cloud relationship, which matters for a compliance-focused business that cannot afford to add vendor onboarding cycles.
5 Florida Attorney General Sues OpenAI and Sam Altman Over ChatGPT Safety <i>Florida AG, CNBC, NPR, CNN, ABC News, June 1</i> Florida AG James Uthmeier filed suit against OpenAI and CEO Sam Altman, accusing the company of putting profit over safety and concealing ChatGPT risks, particularly to children. The suit alleges violations of the Florida Deceptive and Unfair Trade Practices Act and seeks to hold Altman personally liable. Florida is the first state to sue OpenAI directly.	State-level product-liability enforcement against AI companies has begun, with a specific legal theory: that AI products are marketed as safe while providers know about specific harms. Any organization deploying or relying on an AI vendor whose product touches consumers should expect product-liability questions to follow. IN PLAIN TERMS <i>Like the moment state AGs began suing tobacco companies under consumer-protection law. The legal theory was new, the implications were broad, and it changed how the industry talked about its products.</i>	STATE AI ENFORCEMENT SETS A NEW PRECEDENT The first state AG suit against an AI company creates a template other states will study. For Incserv, the relevance is that your entity-management clients face AI-related compliance exposure when their operations touch AI products, and they will look to their registered agent for context on what this means for their jurisdictions.

THE WEEK

IN ONE LINE

The federal government used export controls to shut off frontier AI models overnight, while a bipartisan House draft proposed freezing state AI development rules, and concrete vulnerabilities exposed the security gap around AI agents. For Incserv, the through-line is that the regulatory and security infrastructure around AI is moving from advisory to enforceable, and single-vendor dependence is now a compliance question.
